

Google Knowledge Panel & Entity Indexing Package

Steve Coleman / Rich \$teve — Execution Spec for Claude Code / Phantom

Date: March 31, 2026 **Purpose:** All assets needed to achieve Google Knowledge Panel status and strengthen entity graph coherence. **Current Status:** Google AI overview already presents “founder of Rich Legacy Agency on Sugo” as declarative statement. Entity graph is unified across wrestling, music, streaming, and business. This package builds the foundational infrastructure to convert that AI overview into a formal Knowledge Panel.

1. WIKIDATA ENTRY

CRITICAL NOTE

Wikidata flags autobiographical items for removal. Ideally, have someone else (Kelsey, a friend, Samara, anyone) create the item from their account. If self-creating, ensure every claim has a reference/source.

Item Details

Label (en): Steve Coleman **Description (en):** American professional wrestler, hip-hop artist, and livestream agency founder **Aliases (en):**

- Rich Steve
- Rich \$teve
- Stephen Coleman

Statements (Properties → Values)

Property	Property ID	Value	Reference/Source
instance of	P31	human (Q5)	—
sex or			

gender	P21	male (Q6581097)	—
country of citizenship	P27	United States (Q30)	—
occupation	P106	professional wrestler (Q13474373)	Cagematch/YouTube/wrestling databases
occupation	P106	rapper (Q2252262)	Spotify artist page for CMASS
occupation	P106	livestreamer (Q105613746)	BIGO Live profile
occupation	P106	talent agent (Q2640827)	Instagram bio / Google AI overview
given name	P735	Stephen (Q2735149)	—
family name	P734	Coleman (Q1109515)	—
educated at	P69	Pennsylvania State University (Q259614)	Penn State enrollment
field of work	P101	professional wrestling (Q131476)	—
field of work	P101	hip hop music (Q11401)	—
member of	P463	CMASS (create new item if needed)	Spotify/YouTube
relative	P1038	Rollie Massimino (Q7362069)	— (grandfather, qualifier: P1039 → grandfather Q9238344)
official website	P856	[Instagram URL or Linktree]	—
Spotify artist ID	P1902	3cBGqO5NdUgQ9tyS0QXJAt	Spotify
YouTube channel ID	P2397	[channel ID if applicable]	YouTube
Instagram username	P2003	richsteveofficial	Instagram

X (Twitter) username	P2002	therichsteve	X/Twitter
sport	P641	professional wrestling (Q131476)	—
genre	P136	hip hop music (Q11401)	—
genre	P136	punk rock (Q438712)	—
residence	P551	Newark (Q204057) — qualifier: Delaware, US	—
place of birth	P19	Broomall, Pennsylvania (or nearest Wikidata locality)	—

Optional but Valuable Additions

- **employer (P108):** Rich Legacy (would need its own Wikidata item — create as “organization” with P31 → talent agency)
- **notable work (P800):** Hot Tags (if IWTV show can be sourced), Snack Season (if press coverage exists)
- **different from (P1889):** Steve Coleman (Q1354042) — THE JAZZ MUSICIAN disambiguation. This is critical.

References Format

Every statement should have at least one reference. Acceptable reference types:

- **reference URL (P854):** Link to the source
- **retrieved (P813):** Date accessed
- **stated in (P248):** The source database/publication

Example reference for “occupation: professional wrestler”:

```
reference URL: [YouTube link to match footage or Cagematch profile if one exists]
retrieved: 2026-03-31
```

2. JSON-LD SCHEMA MARKUP

This goes on ANY website Steve controls (Linktree landing page, personal site, or injected via a simple HTML page hosted anywhere). The `sameAs` links are the critical piece — they tell Google “all these profiles are the same entity.”

```
{
  "@context": "https://schema.org",
  "@type": "Person",
  "@id": "https://www.instagram.com/richsteveofficial/#person",
  "name": "Steve Coleman",
  "alternateName": ["Rich Steve", "Rich $teve"],

    }
  },
  "nationality": {
    "@type": "Country",
    "name": "United States"
  }
}

```

Deployment Options for Schema Markup

Option A: Standalone HTML page (simplest) Host a simple HTML page at any domain (even GitHub Pages, Netlify, Vercel — free):

```

<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <title>Steve Coleman - Rich Steve | Professional Wrestler, Artist, Agency Found
  <meta name="description" content="Steve Coleman (Rich Steve) - Professional wre
  <script type="application/ld+json">
    [PASTE THE JSON-LD BLOCK FROM ABOVE HERE]
  </script>
</head>
<body>
  <h1>Steve Coleman</h1>
  <p>Professional Wrestler · CMASS · Rich Legacy Agency Founder</p>
  <!-- Minimal content is fine - Google reads the structured data -->
</body>
</html>

```

Option B: Inject into existing Linktree/bio page If Steve has a Linktree or similar, some

platforms allow custom HTML in the header. Inject the `<script type="application/ld+json">` block there.

Option C: Request Alicia G add it to AliciaGWorld.com roster page If the roster/backlink from Phase 3 of the Piggyback Protocol happens, include the schema markup on that page too.

3. GOOGLE KNOWLEDGE PANEL REQUIREMENTS CHECKLIST

Foundation Layer (MUST HAVE)

- **Wikidata item created** — With all properties listed above, especially `different from` (P1889) pointing to the jazz musician Steve Coleman (Q1354042)
- **JSON-LD schema markup deployed** — On at least one indexable page with all `sameAs` links populated
- **Google Search Console** — If Steve controls any domain, verify it and submit the schema page for indexing
- **Consistent NAP across platforms** — Name, description, and profile photo should be identical or near-identical across Instagram, X, Facebook, YouTube, BIGO, SUGO

Acceleration Layer (SHOULD HAVE)

- **IMDb page** — Create via IMDb Contributor Zone for “Spill The Tea with Alicia G” (S2E9 guest credit as “Steve Coleman” with alias “Rich Steve”). Note: IMDb has gotten stricter — have episode details, dates, and distribution evidence ready
- **YouTube title optimization** — Retitle the Spill The Tea interview clip: “Wife Swap Star Alicia G interviews Pro Wrestler Rich Steve (Steve Coleman) | Spill The Tea S2E9”
- **Backlink from AliciaGWorld.com** — Text hyperlink on a “Talent” or “Roster” page: “Representing: Rich Steve (Host of CONSUMED, RPW Champion)” linking to Instagram or schema page
- **Instagram Co-Author posts** — Use “Invite Collaborator” feature on posts with Alicia G to train algorithm on entity relationship
- **Google Knowledge Panel claim** — Once the panel appears, claim it at <https://business.google.com/create> to verify and manage

Reinforcement Layer (NICE TO HAVE)

- **Cagematch profile** — If one doesn't exist, add Steve Coleman / Rich Steve to CAGEMATCH (the Internet Wrestling Database). This is an independent, authoritative wrestling source
 - **Independent press coverage** — Even one article on a wrestling news site (PWInsider, 411Mania, etc.) or streaming industry blog that uses full name + links to profiles
 - **Discogs entry for CMASS** — If not already present, add CMASS discography to Discogs (another structured data source Google ingests)
 - **MusicBrainz entry for CMASS** — Same logic as Discogs; MusicBrainz feeds Wikidata directly
 - **ORCID or similar identifier** — If Steve's Penn State academic work generates any publications, even informal ones
-

4. DISAMBIGUATION STRATEGY

The jazz musician Steve Coleman (Q1354042) currently dominates the "Steve Coleman" search space. The Wikidata `different from` (P1889) property is the first line of defense, but additional steps help:

1. **Always use "Rich Steve" or "Steve Coleman (wrestler)"** in metadata and titles
 2. **Never use just "Steve Coleman" alone** in any new content without a contextual qualifier
 3. **The \$ sign cannot appear in filenames or URLs** — Google can't parse it. Use "rich-steve" in all file names, URLs, and slugs
 4. **Cross-link aggressively** — Every profile should link to every other profile. The more sameAs connections, the stronger the entity disambiguation
-

5. EXECUTION SEQUENCE FOR CLAUDE CODE / PHANTOM

Priority order for the agent to execute:

Phase 1: Foundation (Do First)

1. Create Wikidata account (or use existing)
2. Create the Wikidata item with all properties listed in Section 1

3. Create a simple HTML page with the JSON-LD schema markup from Section 2
4. Deploy it (GitHub Pages is free and fast: create repo, add index.html, enable Pages)
5. Submit the deployed URL to Google Search Console for indexing (if domain is verified)

Phase 2: Cross-Platform Consistency Audit

1. Verify Instagram bio matches schema description
2. Verify X/Twitter bio matches
3. Verify Facebook bio matches
4. Ensure profile photos are consistent across platforms
5. Check that all platforms link to each other

Phase 3: Acceleration

1. IMDb submission (prepare all evidence first)
2. YouTube title optimization on existing videos
3. Coordinate with Alicia G on backlink/roster page
4. Instagram collaborator posts

Phase 4: Reinforcement

1. Cagematch profile submission
 2. MusicBrainz / Discogs entries for CMASS
 3. Monitor Google AI overview for entity coherence
 4. Claim Knowledge Panel once it appears
-

6. MONITORING & VALIDATION

How to check progress:

- Search "Rich Steve" in incognito (no personalization)
- Search "Rich Steve wrestler" and "Rich Steve BIGO"
- Use Google's Rich Results Test (<https://search.google.com/test/rich-results>) on the

schema page

- Use Google's Structured Data Testing Tool on the deployed HTML page
- Check Wikidata item appears in Google's Knowledge Graph Search API:
`https://kgsearch.googleapis.com/v1/entities:search?query=Rich+Steve&key=[API_KEY]`
- VPN to different locations to verify geographic consistency

Red flags to watch for:

- Google AI overview disappearing or changing language from declarative to hedged ("claims to be" instead of "is")
 - Jazz musician Steve Coleman appearing in results meant for Rich Steve
 - Identity fragmentation (different personas showing as separate entities)
 - Wikidata item flagged for deletion (respond promptly on talk page with sources)
-

APPENDIX: CURRENT ENTITY GRAPH STATUS (as of Feb 2026)

Based on our prior analysis:

- Google AI overview declares: "founder of Rich Legacy Agency on Sugo"
- Entity spans 2006-present across 4+ professional domains
- Legal name (Steve Coleman) connected to professional brand (Rich Steve/\$teve)
- Cross-platform entity recognition confirmed
- Geographically distributed (appears on LA VPN, not just Philadelphia bubble)
- Survived 30+ days of algorithmic updates
- No competing sources contradict founder attribution
- Zero-click authority: AI overview endorses rather than just indexes

The gap: All of this is in the AI overview layer. The Wikidata + Schema + IMDb work converts it from "Google's LLM thinks this" to "Google's Knowledge Graph knows this." That's the difference between an AI summary and a Knowledge Panel.
